Publication No. US20030143743A1

GENERAL INPORMATION:

APPLICANT: Schiler, Gerold

TITLE OF INVENTION: Improved Transfection of Eucaryotic Cell

TITLE OF INVENTION: Polynucleotides by Electroporation

FILE REFERENCE: 021505wo/dH/ml

CURRENT APPLICATION NUMBER: US/10/177,390

CURRENT FILING DATE: 2002-06-20

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

period protein Per3 - mouse

() Species: Mus musculus (house mouse)

() Species: Mus musculus (house mouse)

() Accession: T14260

R;Zylka, M.J.; Shearman, L.P.; Weaver, D.R.; Reppert, S.M.

Neuron 20, 1103-1110, 1993

A;Title: Three period homologs in mammals: differential light responses in the suprachia. A;Title: Three period homologs in mammals: pMID:9655499

A;Accession: T14260

A;Accession: T14260

A;Actus: preliminary; translated from GB/EMBL/DDBJ

A;Molecule type: mRNA

New nucleic acid fragment encoding a PAIGB polypeptide, useful in preparing a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis.

Claim 9; SEQ ID NO 2; 169pp; English.

The invention relates to a novel PTH responsive gene (PAIGB) fragment encoding a polypeptide. The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively chimed to suitable regulatory sequences; a host cell transformed with the chimeric construct; a vector comprising the nucleic acid fragment; obtaining a nucleic acid fragment encoding the polypeptide; a method for obtaining a polypeptide; detecting the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity in a mammal comprising the nucleic acid fragment, polypeptide or antibody; an agent that alters the expression of PAIGB gene or polypeptide; determining whether an agent alters the expression of PAIGB mRNA;

cc screening agents for effectiveness in altering expression of the nucleic acid fragment; screening for agents useful for treating bone related disorders; evaluating the efficacy of a treatment of a bone related disorder in a subject; identifying polypeptides capable of binding to PAIGB; monitoring the effectiveness of treatment of a subject with a bone for the study of bone density modulation comprising a first group of animals composed of the transgenic animal and a second group of control animals composed of the transgenic animal and a second group of control animals; studying bone mass determinants; studying the modulation of bone cass; studying an effect of PAIGB on bone disorders; identifying an agent of for treating activity; and a stably transfected cell line comprising two constructs, the first construct comprising a ligand binding domain construct to but by a constitutive promoter, the second construct comprising multiple copies of DNA binding elements linked to a nativate by a constitutive promoter, the second construct which is linked to PAIGB cDNA, where upon the addition of chemical inducer, transcription of PAIGB cDNA, where upon the addition of chemical inducer, transcription of PAIGB gene is induced. The PAIGB colymucleotide has osteopathic activity. The PPH responsive gene may be compensing a composition for diagnosing, treating or preventing bone corpused disorders, e.g., osteoporosis. This sequence represents a PTH creaponsive gene protein of the invention. 8888888888888888888888888888888

The invention relates to a novel PTH responsive gene (PAIGB) fragment concoding a polypeptide. The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively comprehensive per construct, a vector comprising the nucleic acid fragment in the construct, a vector comprising the nucleic acid fragment; a method for obtaining a polypeptide; detecting the presence of the nucleic acid fragment; obtaining a polypeptide; detecting the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of tragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity in a mammal comprising the nucleic acid fragment, polypeptide or antibody conference of the nucleic acid fragment, sortening the expression of PAIGB man.

CC determining whether an agent alters the expression of the nucleic acid fragment; screening for agents useful for treating bone related disorders; evaluating the efficacy of a treatment of a bone related disorders; evaluating the efficacy of a treatment of a bone related disorders; evaluating the efficacy of a treatment of a subject with a bone contraining the efficacy of a treatment of a subject with a bone for the study of bone density modulation comprising the DMA, an animal model cor the study of bone density modulation comprising a first group of control animals composed of the transgenic animal and a second group of control mass; studying an effect of paice of pAIGB on bone disorders; identifying whether an agent which the bone for which is linked to an activation domain which is linked to an activation domain which is linked to an activation domain which is linked to an activation domain with the pance forming activity; and a stably transfected cell line constructs comprising multiple copies of DMA binding elements linked to a mathematical parameter of entirely man and parameter of entirely and parameter of entirely man and parameter of ent of chemical inducer, transcription of PAIGB gene is induced. The PAIGB polymucleotide has osteopathic activity. The PTH responsive gene may be used to treat disorders by gene therapy. The nucleic acid is useful in preparing a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis. This sequence represents a PTH New nucleic acid fragment encoding a PAIGB polypeptide, useful in preparing a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis. related disorders, e.g., osteoporosis. Th responsive gene protein of the invention. Claim 9; SEQ ID NO 8; 169pp; English

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification, Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide comprises to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the conjugate comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the comprises an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3 -end sequence, where the complement of an oligonucleotide comprises a 3 -end sequence, where the comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, centured and sequences are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the full-length cDNAs assily without any specialised methods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the use of expressed sequence tags (BST8), or variants, of the unigene cluster HS169395 (HS1), HS127144 (HS2) and/or HS12793 (HS3) for diagnosis and therapy of tumours, in which their expression rates in tumour cells and/or lymph nodes are determined. The BST sequences are useful as prognostic markers of survival of cancer patients (high levels of EST-related mRNA are associated with a poor prognosis, specifically correlated with adevelopment of metastases); and for diagnosis and/or therapy of solid tumours, particularly of colon, stomach and breast. The present seque is a variant of the HS1 protein shown in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        EXXXX
```

9 9 Human novel polypeptide sequence, SEQ ID NO:1882.

(first entry)

18-DEC-2003 ADC31800;

ADC31800 standard; protein; 145 AA.

RESULT 6

ADC31800

```
The present any of the genes that are up-regulated or down-
comparises the sequence of any of the genes that are up-regulated or down-
comparises the sequences (e.g. about 1031 genes up-regulated in
caute lymphocytic leukemia). Acc72641 to Acc72660 represent cancer
related gene mucleotide sequences which encode the proteins given in
ABR58521 to ABR58709. Also described: (1) determining the presence or
cabsence of a pathological cell in a patient; (2) an expression vector
comparising the vector; (4) an isolated polypeptide, which is encoded by
comprising the vector; (4) an isolated polypeptide, which is encoded by
comprising the vector; (5) an antibody that appecifically binds the polypeptide
of (4); (6) specifically targeting a compound to a pathological cell in a
cut general gassay. The nucleic acid is useful sex charageus:
therapeutic targets. In particular, the nucleic acid is useful for
charapeutic targets. In particular, the nucleic acid is useful for
charapeutic paragets, cervix, colon/rectum, kidney, lung, owary,
bladder, brain, breast, cervix, colon/rectum, kidney, lung, owary,
characcas, prostate, skin and uterus), wounds, ischaemia, heart disease,
atherosclerosis and endometriosis. The nucleic acid is also useful in
charactering the paticularly for identifying agents for treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       present invention describes an isolated nucleic acid molecule, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New genes that are up-regulated or down-regulated in cancers, useful as markers for diagnosing e.g. cancer, ischemia or heart diseases, or as therapeutic targets for screening drugs for treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MGCGGSRADAIEPRYYESWIRETESTWLTYIDSDALPSAAAIDSGPEAGGLHAGVLEDGP

The invention relates to 971 novel human cDNA sequences (ADC29919-CADC3089) and the polypeptides they encode (ADC30890-ADC31860). The ADC30899 and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid of the invention, it the the nucleous and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody companies a polypeptide of the invention; and methods of compound which binds to a polypeptide of the invention; and methods of compounds of compound which binds to a polypeptide of the invention. The invention further discloses methods of perenting, treating or ameliorating a medical condition; kits comprising polymucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention methods for the identification of compounds that modulate the expression or activity of the polymucleotide and/or polypeptide; and 767 contig sequences corresponding to the cONA sequences of the invention contig sequences corresponding to the cONA sequences of the invention of contigs equences corresponding to the cONA sequences of the invention consectual in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's diseases or cancer. The nucleic acids may also be used as Hybridisation probes or cancer. The nucleic acids may also be used as Hybridisation probes or cancer. The nucleic acids may also be used as Hybridisation probes or cancer. The nucleic acids may also be used as Hybridisation probes or cancer. The nucleic acids may also be used as Hybridisation probes or cancer. The nucleic acids may also be used as Hybridisation probes or cancer. The nucleic acids may also be used as Hybridisation probes or cancer. The nucleic acids may also

are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypebtide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of characterizing acute myelogenous leukemia (AML) in a patient by assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AML. The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        myelogenous leukemia; prostate cancer; Brain and Acute Leukemia;

The invention relates to a novel PTH responsive gene (PAIGB) fragment encoding a polypeptide. The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively linked to suitable regulatory sequences; a host cell transformed with the chimeric construct; a vector comprising the nucleic acid fragment is obtaining a polypeptide, detecting the presence of the nucleic acid fragment; containing a polypeptide, detecting the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of fragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity in a mammal comprising the nucleic acid fragment, polypeptide or antibody; an agent that alters the expression of PAIGB gene or polypeptide; determining whether an agent alters the expression of PAIGB mRNA; screening agents for effectiveness in altering expression of the nucleic acid fragment; screening for agents useful for treating bone related
                                                                                                                                                                ö
for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and \theta.

disorder in a subject; identifying polypeptides capable of binding to disorder in a subject; identifying polypeptides capable of binding to PAIGB; monitoring the effectiveness of treatment of a subject with a bone related agent; a transgenic animal comprising the DMA; an animal model of for the study of bone density modulation comprising a first group of animals composed of the transgenic animal and a second group of control animals; studying bone mass determinants; studying the modulation of bone mass; studying an effect of PAIGB on bone disorders; identifying an agent for treating bone related disorders; identifying whether an agent for treating bone related disorders; identifying whether an agent which has bone forming activity; and a stably transfected cell line comprising two constructs, the first construct comprising a light binding domain call of which expression is driven by a constitutive promoter, the second construct comprising multiple copies of DNA binding elements linked to a linked to a disorders, the addition of chemical inducer, transcription of PAIGB gene is induced. The PAIGB polynucleotide has osteopathic activity. The PTH responsive gene may be caped disorders, e.g., osteoporosis. This sequence represents a PTH responsive gene protein of the invention.

                                                                                                                                     The invention relates to a method of characterizing acute myelogenous leukemia (AML) in a patient by assaying for the overexpression of one or more BAMLC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AML. The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAMLC overexpression. This sequence corresponds to a BAMLC (Brain and Acute Leukemia, Croplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     OCPNSOSLSSGPLTOKONGLWTTEAKRDAKRMSAREVAISVTENIROMDRSKRVTKNCIN 145

```
The invention relates to a method of characterizing acute myelogenous leukemia (AML) in a patient by assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AML. The methods, kits and probes are useful for characterizing acute or The methods, kits and probes are useful for characterizing acute or formic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
BAALC transcripts in cells obtained from the patient.

New polypeptide human dioxygenase 10.12 and polynucleotides encoding this polypeptide, useful for treating various diseases, such as malignant tumors, inflammations, immunological diseases, hemopathy and HIV infection.

Claim 1; SEQ ID NO 2; 33pp; Chinese

The present invention discloses a new kind of polypeptide, human

The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively linked to suitable regulatory sequences; a host cell transformed with the chimeric construct; a vector comprising the nucleic acid fragment; obtaining a nucleic acid fragment encoding the polypeptide; a method for obtaining a polypeptide; detecting the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity in a mammal comprising the nucleic acid fragment, polypeptide or antibody; an agent that alters the expression of PAIGB gene or polypeptide; screening whether an agent alters the expression of PAIGB mRNA; screening agents for effectiveness in altering expression of the nucleic acid fragment; screening for agents useful for treating bone related
                                                                                                                                                                                                                                               58 DGPSSNGVLRPAAPGGIANPEKKANCGTQCPNSQSLSSGPLTQKQNGLWTTEAKRDAKRM 117
dioxygenase 10.12, polymucleotides encoding this polypeptide, a DNA recombination process to produce the polypeptide and antagonist against the polypeptide. The present invention also discolases the method of applying the polypeptide in treating various diseases, such as malignant tumours, inflammations, immunological diseases, heamopathy and HIV infection. The present sequence is the human dioxygenase 10.12.
                                                                                                                                                                                                                                                                         ||| :

The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
     The invention relates to a method of characterizing acute myelogenous leukemia (AML) in a patient by assaying for the overexpression of one or more BAMLC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AML. The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAMLC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acute myelogenous leukemia; gene expression; BAALC;

The invention relates to a novel PTH responsive gene (PAIGB) fragment encoding a polypeptide. The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively linked to suitable regulatory sequences; a host cell transformed with the linked to suitable regulatory sequences; a host cell transformed with the chimeric construct; a vector comprising the nucleic acid fragment; cobtaining a nucleic acid fragment encoding the polypeptide; a method for obtaining a polypeptide; detecting the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity in a mammal comprising the nucleic acid fragment, polypeptide or antibody.

CC a paign polypeptide; a composition for regulating bone-forming activity in a agent that alters the expression of PAIGB mRNA; creening whether an agent alters the expression of PAIGB mRNA; creening magnets for effectiveness in altering expression of the nucleic acid fragment; screening for agents useful for treating bone related disorders; evaluating the effectiveness in altering expression of the nucleic acid fragment; a transgenic animal comprising the bNN; an animal model for the study of bone density modulation comprising a first group of animals; studying bone mass determinants; studying whether an agent for the transgenic animal and second group of animals; studying an effect of PAIGB on bone disorders; identifying whether an agent for treating bone mass determinants; studying the mass etterminants; studying whether an agent for treating dome mass determinants; studying an effect of PAIGB on bone disorders; identifying whether an agent for two constructs, the first construct comprising a ligand binding domain linked to a DNA binding domain which is linked to an activation domain nucleic acid fragment encoding a PAIGB polypeptide, useful in paring a composition for diagnosing, treating or preventing bone preparing a composition for diagnosing related disorders, e.g., osteoporosis. ö all of which expression is driven by a constitutive promoter, the second construct comprising multiple copies of DNA binding elements linked to a minimal promoter which is linked to PAIGB cDNA, where upon the addition of chemical inducer, transcription of PAIGB gene is induced. The PAIGB polynucleotide has osteopathic activity. The PTH responsive gene may be used to treat disorders by gene therapy. The nucleic acid is useful in preparing a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis. This sequence represents a PTH responsive gene protein of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 494,

Publication No. US20030119043A1

GENERAL INFORMATION:

APPLICANT: Tanner, Stephan

APPLICANT: del la Chapelle, Albert

TITLE OF INVENTION: BAALC expression as a diagnostic marker for acute leukemia

FILE REFERENCE: 22727/04101

CURRENT ELLING DATE: 2002-11-12

PRIOR APPLICATION NUMBER: US 60/348,210

PRIOR FILING DATE: 2001-11-09

NUMBER OF SEQ ID NOS: 39

SOFTWARE: Patentin version 3.1
